

Brief:

Here, we want to implement Flight search functionality. You have a form, where user can input and search for the flights. Then user will be able to see the search results, user can refine the search using a slider for prices.

Problem statement:

- Create a flight JSON data object for your all flights available to make the search happen.
- Take the User input from the search form and perform a search on the flight JSON data and display the valid search results in the results section.
- There are two tabs for return and one way search form, the return date should be visible on basis of the tab selected.
- Slider should refine the search results based on the selected price range.
- Feel free to use any JS frameworks (like Angular or ReactJS) or Core JS to build this application.
- Test your code with some unit tests.

What are we looking for:

- Code structure and organization
- Simplicity and ease of understanding the code
- Understanding of JavaScript, Unit Test, HTML, JSON and CSS

Brownie Points:

- Make the page Responsive i.e. device friendly (ipad, iphone, android) and compatible with all modern browsers.
- Creativity in terms of look and feel of the page. (No CSS frameworks like Bootstrap, Foundation etc)

Wireframe for assignment:

Flight Search Engine

One way Return
